probable 17K protein - vaccinia virus (strain Ankara)
C:Species: vaccinia virus
A:Variety: Strain Ankara
C:Date: 21-Jan-2000 #sequence_revision 21-Jan-2000 #text_change 18-Feb-2000
C:Accession: T37373
R:Antoine, G.; Scheiflinger, F.; Falkner, F.G.; Dorner, F.
submitted to the EMBL Data Library, March 1997
A:Description: The complete genomic sequence of the Modified Vaccinia Ankara (MVA) strain A:Reference number: Z20877
A:Accession: T37373
A:Status: preliminary; translated from GB/EMBL/DDBJ
A:Residues: 1-146 <ANTY
A:Cross-references: EMBL:U94848; PIDN:AAB96510.1
A:Experimental source: strain Ankara
C:Genetics:
A:Note: MVA097R
C:Superfamily: vaccinia virus H8 protein
                                                                                                                                                                                                                                                                                                                                          dynein heavy chain 3 - Chlamydomonas reinhardtii (fragment)
C;Species: Chlamydomonas reinhardtii
C;Date: 04-Feb-1998 #sequence_revision 13-Feb-1998 #text_change 21-Jui-2000
C;Accession: $72241

PT pho: Novel antibody for modulating angiogenesis and endothelial cell migration and proliferation, binds endothelial cell receptor tyrosine phosphatase/density enhanced phosphatase-1 WPI; 2001-570681/64. ECRTP/DEP-1; endothelial cell receptor tyrosine phosphatase; density enhanced phosphatase-1; anti-inflammatory; antipsoriatic; antiheumatic; antidiabetic; antiatherosclerotic; cytostatic; osteopathic; angiogenesis inhibitor; tumour; cancer. 01-MAR-2000; 2000US-0516728 27-FEB-2001; 2001WO-US06178 07-SEP-2001. Mammalia. (UYVA-) UNIV VANDERBILT. WO200164750-A2 Sequence #1 for epitope of ECRTP/DEP-1 ectodomain binding antibody. 03-JAN-2002 AAU03200; AAU03200 standard; peptide; 8 то, Takahashi T, (first entry) Mernaugh À

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and may be an ECRTP/DEP-1 modulator, ECRTP/DEP-1 dimerisation promoter or antagonist and angiogenesis inhibitor. The purified antibody blocks endothelial migration and proliferation and inhibits angiogenesis in disorders such as inflammatory disorders including immune and non-immune inflammation, chronic articular rheumatism and psoriasis, disorders associated with inappropriate invasion of vessels such as diabetic retinopathy, neovascular glaucoma, capillary proliferation in atherosclerotic plaques, osteoporosis and cancer associated disorders atherosclerotic plaques, osteoporosis and cancer associated disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a novel purified antibody (or its fragment or derivative) which preferentially binds an endothelial cell receptor tyrosine phosphatase/density enhanced phosphatase-1 (ECREP/DEP-1). The antibody has antiinflammatory, antipsoriatic, antirheumatic, antidiabetic, antiatherosclerotic, cytostatic and osteopathic activities antidiabetic, antiatherosclerotic, cytostatic and osteopathic activities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          such as solid tumours, solid tumour metastases, angiofibromas, retrolental fibroplasia, hemangiomas, Kaposi's sarcoma and similar cancers. This sequence is peptide sequence #1 for epitope ECRTP/DEP-1 ectodomain binding antibody used to modulate angiogenesis, described the method of the invention.

Note: This sequence for ECRTP/DEP-1 epitope, given in example 4, different that given in claim 3 (AAU08802).
                                                                                                                                                                                                                                                                                                                      09-NOV-1995
                                                                                                                                                                                                                                                                                                                                                   WO9530008-A1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventiuseful in developmental biology and in elucidating cell signalling (cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL101840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                        23-MAR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to peptide sequences present in the synovial fluid and membranes of rheumatoid arthritis patients, arising from the CDR region of oligoclonal pathogenic T-cell antigen receptor Vbeta chains. Compositions which contain autoantigenic peptides binding specifically to T-cells expressing receptors containing the peptide sequences, which include antigen-specific immunological tolerance to rheumatoid arthritis can be used for the treatment and prevention of rheumatoid arthritis. The invention can be used for the diagnosis, treatment and prevention of rheumatoid arthritis. Sequences AAY66771-958 represent peptides from the various Vbeta chains of T cell antigen receptor.

The human and murine sequences are given in (AAQ51543-45), peptide fragments able to generate antibodies are given in (AARS1951-61)

                                                                                                                        A method for serum type classification of TT virus (also known as hepatitis TT virus) has been identified. The method relies on the use of peptide fragments of the virus. The invention also relates to the use of TT virus peptides for anti-TT virus antibody determination. The anti-TT virus antibodies and the serum type classification method, can be used to screen TT virus, to determine its route of infection, and seroconversion. The classification of TT virus may lead to improved treatment of viral disease. The present sequence represents a fragment of TT virus protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A method for serum type classification of TT virus (also known as hepatitis TT virus) has been identified.                                         The invention relates to a transgenic monocot plant comprising an isolated DNA operably linked to a promoter, which is expressed to yield a prolamin box binding factor peptide (PBF). PBF then binds to promoter regions of 22-kD alpha-zein (prolamin seed storage proteins of promoter regions of 22-kD alpha-zein (prolamin seed storage proteins of maize are named zein) and 27-kD gamma-zein genes, so as to enhance gamma-zein production and lower alpha-zein production, so that methionine and lysine content of plant seed is increased over the content in native plant. PBF protein is a novel endosperm-specific cys2-cys2 zinc finger-type DNA binding protein of the DDF family. The transgenic monocot plant is a maize plant and expresses increased levels of methionine and/or lysine content in the seeds of the plant. The development of transgenic lines which supply higher levels of methionine reduces the need for methionine supplements for corn-soybean meal poultry feed and conceased lysine content of either the cereal grains or the oilseed crops results in significant added nutritional value. The present is maize of methionine domain ZMDOF2. This sequence contains a dof domain at the

                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to ERA binding domain polypeptides (AAG99959-AAG99989 and AAM01010-AAM0021). The era gene in Escherichia coli codes for an essential GTPase protein able to autophosphorylate at serine and/or threonine residues. The protein has potential antimicrobial and antibacterial activity and is useful in screening for antagonists, agonists and for compounds with antibiotic activity. The proteins are also useful in determining their role in pathogenesis of infection, dysfunction and disease and could be used as part of a vaccine and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (SMIK )

                                                                                                                                         presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                polypeptides. The proteins and their associated DNA sequences are used the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central process is also involved in infections of bone, joints and the central process.

                                                                                                                                                                                                                                                            The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, haematopolesis regulating activity, thissue growth factor activity. The diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, cancer diagnosis and therapy, drug screening, and thrombolytic activity, cancer diagnosis and therapy, drug screening, and thrombolytic activity, cancer diagnosis and inflammation, leukaemias and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method for serum type classification of TT virus (also known as hepatiris TT virus) has been identified. The method relies on the use of peptide fragments of the virus. The invention also relates to the use of TT virus peptides for anti-TT virus antibody determination. The anti-TT virus antibodies and the serum type classification method, can be used to screen TT virus, to determine its route of infection, and seroconversion. The classification of TT virus may lead to improved treatment of viral disease. The present sequence represents a fragment of TT virus protein

A method for serum type classification of TT virus (also known as hepatitis TT virus) has been identified. The method relies on the use of peptide fragments of the virus. The invention also relates to the use of TT virus peptides for anti-TT virus antibody determination. The anti-TT virus antibodies and the serum type classification method, can be used to screen TT virus, to determine its route of infection, and seroconversion.

, can be used to seroconversion.

SSSSS

Sequence 90 AA;

The classification of TT virus may lead to improved treatment of viral disease. The present sequence represents a fragment of TT virus protein used in the course of the invention.
